

HTML Basics

What is HTML?

HTML stands for HyperText Markup Language.

HTML is a **standard markup language used to create and structure webpages.**

HTML tells the browser **what the content is and how it should be structured.**

Example:

```
<h1>Welcome to HTML</h1>
```

```
<p>HTML is used to create webpages.</p>
```

HTML Meaning

H → Hyper

Hyper means connecting or linking one webpage/document to another.

Example:

```
<a href="https://google.com">Go to Google</a>
```

Hyper = Linking webpages/documents

T → Text

Text means the content displayed on a webpage.

Example:

```
<p>Welcome to my website</p>
```

Here, "**Welcome to my website**" is the text/content.

Text = Content displayed on a webpage

M → Markup

Markup means using HTML tags to define the structure and meaning of content.

Example:

```
<h1>My Website</h1>
```

```
<p>This is my webpage.</p>
```

- `<h1>` → Defines a heading
- `<p>` → Defines a paragraph

Markup = Giving structure and meaning to content

L → Language

Language means a system of rules and syntax used to communicate information.

HTML has its own syntax and rules that browsers understand.

Language = Rules and syntax used to structure webpages

What Can We Create Using HTML?

HTML can be used to structure:

- Headings
 - Paragraphs
 - Links
 - Images
 - Videos
 - Audio
 - Lists
 - Tables
 - Forms
 - Buttons
 - Sections
 - Navigation
 - Webpage layouts
-

HTML is Not a Programming Language

HTML is a **Markup Language**, not a programming language.

HTML is mainly used for:

- Creating structure
- Organizing content
- Defining webpage elements

Programming languages such as **JavaScript** are used for:

- Logic
- Conditions
- Loops
- Functions
- Calculations
- Dynamic behavior

Basic HTML Example

```
<!DOCTYPE html>

<html>

<head>

<title>My First Webpage</title>

</head>

<body>

<h1>Welcome to My Website</h1>

<p>This is my first HTML webpage.</p>

</body>

</html>
```

Basic HTML Structure

```
<!DOCTYPE html>

<html>

<head>

<!-- Page information -->
```

```
</head>

<body>

<!-- Visible webpage content -->

</body>

</html>
```

Important Parts

Element	Purpose
<!DOCTYPE html>	Tells the browser that the document uses HTML5
<html>	Root element of the webpage
<head>	Contains page information and resources
<title>	Defines the browser tab title
<body>	Contains visible webpage content

HTML Tag

A **tag** is a keyword enclosed inside angle brackets < >.

Example:

```
<p>
```

Common tags:

```
<h1>
```

```
<p>
```

```
<a>
```

```
<img>
```

```
<ul>
```

```
<li>
```

```
<table>
```

<form>

HTML Element

An **HTML element** usually consists of:

Opening Tag + **Content** + Closing Tag

Example:

<p>Hello World</p>

Here:

<p> → Opening Tag

Hello World → Content

</p> → Closing Tag

Together:

<p>Hello World</p>

is an **HTML Element**.

HTML Attribute

An **attribute** provides additional information about an HTML element.

Example:

Google

Here:

href = "https://google.com"

is an **attribute**.

Another example:

Here:

- src → Image location
 - alt → Alternative text
-

Basic HTML Tags

Heading

`<h1>Main Heading</h1>`

`<h2>Sub Heading</h2>`

`<h3>Heading 3</h3>`

HTML provides headings from:

`<h1> to <h6>`

Paragraph

`<p>This is a paragraph.</p>`

Link

`<a href="https://google.com">Google</a>`

Image

``

Line Break

Hello`<br>`

World

Horizontal Line

`<hr>`
